

There are many ways of writing an expression that evaluates to a given number. For example, 2^4 , $(3 + 1)^2$, and $7^2 - 2^3 - 5^2$ all evaluate to 16.

1. Write an expression that evaluates to 12 and contains 2 as an exponent.
2. Write an expression that evaluates to $\frac{64}{9}$ and contains 3 as an exponent.
3. Write an expression that evaluates to 36 and contains 4 as an exponent and at least two different operations.
